## **PDF Baluchon**

## Modèle MVC

## **Bonus Baluchon**

Pour le bonus j'ai décidé d'intégrer une function qui me permet de recueuillir toutes les monnaies pour pouvoir les convertir en euros.

```
func getSymbols(callback: @escaping (Bool, [String]?) -> Void) {
   let fixerUrl = URL(string:
        "http://data.fixer.io/api/symbols?access_key=d595ac5936090b6eea37cd18e76aa86b")
   guard let url = fixerUrl else { return }
dataTask = rateSession.dataTask(with: url) { (data, response, error) in
       guard let data = data, error == nil else {
           callback(false, nil)
            return
        guard let response = response as? HTTPURLResponse, response.statusCode == 200
            callback(false, nil)
        guard let responseJSON = try? JSONDecoder().decode(Symbols.self, from: data)
            callback(false, nil)
            return
        var currencies = [String]()
        responseJSON.symbols.forEach { (key, value) in
            currencies.append(key)
        callback(true, currencies.sorted(by: <))</pre>
   dataTask?.resume()
```

Ensuite j'ai crée grâce à Postman une structure decodable un tableau [String: String] des données des monnaies :

```
struct Symbols: Decodable {
    let symbols: [String: String]
}
```

Pour finir j'ai intégré dans mon controlleur un picker view pour me permettre d'y intégrer toutes les monnaies et pouvoir choisir celle qu'on souhaite pour la convertir en euros :

```
private let exchangeRateService = ExchangeRateService()
private var allRates = [String]()

/// This is the currency convertion
private var currency = "AED"

// MARK: - View Life Cycle

override func viewDidLoad() {
    super.viewDidLoad()
    ratesPickerView.dataSource = self
    ratesPickerView.delegate = self
    exchangeRateService.getSymbols { (success, symbols) in
        if success, let symbols = symbols {
            DispatchQueue.main.async {
                self.allRates = symbols
                self.ratesPickerView.reloadAllComponents()
            }
        }
    }
}
```

Mise en place du picker view :

```
// MARK: - UIPickerViewDelegate, UIPickerViewDataSource
extension ExchangeRateViewController : UIPickerViewDelegate, UIPickerViewDataSource {
    func numberOfComponents(in pickerView: UIPickerView) -> Int {
        return 1
    }

    func pickerView(_ pickerView: UIPickerView, numberOfRowsInComponent component: Int) ->
        Int {
        return allRates.count
    }

    func pickerView(_ pickerView: UIPickerView, titleForRow row: Int, forComponent component: Int) -> String? {
        return allRates[row]
    }

    func pickerView(_ pickerView: UIPickerView, didSelectRow row: Int, inComponent component: Int) {
        currency = allRates[row]
    }
}
```
